

Title: Digital Complaint Management and Its Effect on Public Service Response Time in Local Government Offices

Background of the Study

Local government offices receive different types of public complaints and service requests every day. These may include concerns about permits, sanitation, public safety, infrastructure, traffic, business processing, and community services. In many offices, complaints are still received through walk-ins, phone calls, paper forms, emails, or social media messages. Because the information comes from different channels, tracking the status of each complaint can become difficult.

A digital complaint management system can help organize citizen complaints in one platform. It can record the complainant's details, type of concern, assigned department, date received, action taken, and current status. This can help government employees respond faster and reduce the chance of lost or forgotten complaints. However, the effectiveness of this system depends on how well it is used by staff and whether it improves transparency and accountability.

This study aims to examine how digital complaint management affects public service response time in local government offices. It focuses on whether using a centralized system can help improve monitoring, follow-up, and resolution of citizen concerns.

Statement of the Problem

The main problem addressed by this study is the delay and inconsistency in handling public complaints due to manual or fragmented complaint tracking. Some complaints may be repeated, misplaced, or delayed because there is no clear system for monitoring their progress. This study seeks to understand whether digital complaint management can improve public service response time.

Research Objectives

This study aims to:

1. Identify the common types of complaints received by local government offices.
2. Determine the current process used to record, assign, and resolve complaints.
3. Assess the effect of digital complaint management on response time.
4. Identify challenges experienced by government staff when using digital systems.
5. Recommend ways to improve complaint tracking and public service delivery.

Proposed Methodology

This study will use a descriptive research design. Data may be gathered through surveys and interviews with local government employees who handle public complaints. The study may also

review sample complaint records to compare processing time before and after the use of a digital complaint system.

The collected data will be analyzed using frequency, percentage, mean, and simple comparison of response times. Interview answers may be summarized to identify common issues in complaint handling and system use.

Expected Output

The expected output of this study is a report showing how digital complaint management affects public service response time. The study may identify improvements in tracking, assignment, follow-up, and resolution of complaints. It may also provide recommendations for improving transparency and accountability in local government service delivery.

Significance of the Study

This study may benefit local government offices by showing how digital tools can support faster and more organized complaint handling. It may also benefit citizens by promoting better public service response. The findings may help administrators improve complaint management policies, staff training, and digital service systems.

Keywords

Digital government, public service, complaint management, local government, response time, citizen complaints, government accountability, service delivery, e-governance, case tracking

Title: Social Media Use and Its Relationship with Academic Stress Among College Students

Background of the Study

Social media has become part of the daily routine of many college students. Students use platforms such as Facebook, Instagram, TikTok, X, and Messenger for communication, entertainment, academic updates, and social interaction. While social media can help students stay connected and informed, excessive use may also affect their focus, sleep, time management, and emotional well-being.

Academic stress is common among college students because of deadlines, exams, group projects, performance expectations, and personal responsibilities. Some students use social media as a way to relax or escape stress, while others may feel more stressed because of distractions, comparison with others, or fear of missing out. Because of this, it is important to examine how social media use is related to academic stress.

This study aims to determine the relationship between social media use and academic stress among college students. It will focus on frequency of use, purpose of use, time spent online, and perceived effects on academic responsibilities.

Statement of the Problem

The main problem addressed by this study is the possible connection between social media use and academic stress. While social media may provide emotional support and entertainment, it may also contribute to procrastination, reduced productivity, and increased pressure. This study seeks to understand whether higher social media use is associated with higher levels of academic stress.

Research Objectives

This study aims to:

1. Determine the frequency and purpose of social media use among college students.
2. Assess the level of academic stress experienced by students.
3. Identify common stressors related to academic work.
4. Examine the relationship between social media use and academic stress.
5. Recommend healthy social media habits that may support student well-being.

Proposed Methodology

This study will use a descriptive correlational research design. A survey questionnaire will be distributed to selected college students. The questionnaire will ask about social media usage, time spent online, academic workload, stress levels, sleep habits, and coping strategies.

The data will be analyzed using descriptive statistics and correlation analysis. The study may also include open-ended questions to gather student experiences about how social media affects their academic life.

Expected Output

The expected output of this study is a report showing the relationship between social media use and academic stress. The study may identify whether students who spend more time on social media experience higher stress or whether social media is used mainly as a coping tool.

Significance of the Study

This study may benefit students by helping them become more aware of how social media habits affect their academic performance and mental well-being. It may also help schools design student wellness programs, digital well-being campaigns, and stress management activities.
