

Title: Gamified Learning Activities and Their Effect on Mathematics Motivation Among Junior High School Students

Background of the Study

Mathematics is often seen by students as a difficult and stressful subject. Some students experience low motivation because they find mathematical concepts abstract, repetitive, or hard to apply in real-life situations. Because of this, teachers continue to look for strategies that can make mathematics learning more engaging and interactive.

Gamified learning uses game-like elements such as points, badges, leaderboards, challenges, rewards, and progress levels in classroom activities. These elements may encourage students to participate more actively and complete tasks with greater interest. In mathematics classes, gamified activities may help students practice problem-solving skills in a less intimidating way.

This study aims to examine how gamified learning activities affect mathematics motivation among junior high school students. It will focus on students' interest, participation, confidence, and willingness to complete mathematics tasks.

Statement of the Problem

The main problem addressed by this study is the low motivation of some junior high school students in learning mathematics. Traditional teaching methods may not always sustain student interest, especially when lessons involve complex formulas and problem-solving tasks.

Research Objectives

This study aims to:

1. Identify the gamified learning activities used in mathematics classes.
2. Determine the level of student motivation before and after using gamified activities.
3. Assess the effect of gamification on student participation and confidence.
4. Identify challenges in using gamified activities in mathematics instruction.
5. Recommend strategies for improving mathematics motivation through gamified learning.

Proposed Methodology

This study will use a descriptive quantitative research design. A survey questionnaire will be given to junior high school students who experienced gamified mathematics activities. The questionnaire will focus on motivation, participation, confidence, and attitudes toward mathematics.

The data will be analyzed using frequency, percentage, mean, and ranking. If available, student performance scores before and after the use of gamified activities may also be reviewed as supporting data.

Expected Output

The expected output of this study is a report showing how gamified learning activities affect student motivation in mathematics. The study may also provide recommendations for teachers on how to use gamification effectively in classroom instruction.

Significance of the Study

This study may benefit students by making mathematics learning more engaging and less intimidating. It may also help teachers design activities that improve motivation and participation. School administrators may use the findings to support innovative teaching strategies.
