

Title: Teacher Digital Competence and Its Influence on the Use of Educational Technology in Blended Learning

Background of the Study

Educational technology has become a major part of teaching and learning. Many schools now use blended learning, where face-to-face instruction is combined with online activities, digital materials, and learning platforms. Teachers are expected to use tools such as Learning Management Systems, video conferencing applications, online quizzes, digital presentations, and interactive learning resources.

However, the effective use of educational technology depends on the teacher's digital competence. Some teachers are confident in using digital tools, while others may need more training and support. Digital competence includes the ability to use technology for lesson planning, content delivery, assessment, communication, and student monitoring.

This study aims to examine how teacher digital competence influences the use of educational technology in blended learning. It will focus on teachers' confidence, skills, training, challenges, and actual use of digital tools in instruction.

Statement of the Problem

The main problem addressed by this study is the uneven use of educational technology among teachers in blended learning. While digital tools are available, not all teachers may have the skills or confidence to use them effectively.

Research Objectives

This study aims to:

1. Determine the level of digital competence among teachers.
2. Identify the educational technology tools commonly used in blended learning.
3. Assess how digital competence affects the use of technology in instruction.
4. Identify challenges teachers experience when using digital tools.
5. Recommend training or support programs to improve teacher digital competence.

Proposed Methodology

This study will use a descriptive quantitative research design. A survey questionnaire will be distributed to teachers who are using blended learning in their classes. The questionnaire will measure digital skills, confidence, tool usage, training experience, and challenges.

The collected data will be analyzed using frequency, percentage, mean, and ranking. If available, selected interviews may be conducted to gather additional insights about teacher experiences with educational technology.

Expected Output

The expected output of this study is a report showing the relationship between teacher digital competence and the use of educational technology in blended learning. The study may also recommend areas for teacher training and digital support.

Significance of the Study

This study may benefit teachers by identifying areas where they need additional digital training. It may also help school administrators design professional development programs. Students may also benefit if teachers become more confident and effective in using technology for instruction.
